

ODX-3000

2400...3000 VA DC/AC INVERTER

GENERAL FEATURES:

Sine wave output voltage
 Suitable for motors control
 Selectable output frequency: 50/60 Hz
 Adjustable output voltage
 High input-output isolation 3000 Vrms
 Remote inhibit
 Configurable input: Reverse or Mid power
 Remote control via RS232
 Alarms by isolated relay contacts
 Remote off opto-coupled
 Optional railway version EN50155
 Fire and smoke: EN45545-2 approved

DESCRIPTION

The ODX-3000 consists of three phase sine-wave DC-AC inverters with galvanic isolation between input and output.

The unit allows:

- Changing the output frequency by means of DIP-switch-1 of SW3. OFF: 50 Hz or default programmed, ON: 60 Hz
- Change local/remote (waiting RS-232 commands) by means of DIP-switch-2 of SW3. OFF: local, ON: remote
- Shutdown applying voltage output 15 to 154 V on pins 3 and 4 of J4
- Start-up motors by means of a soft start. In the start-up, the output voltage rises linearly from 0 V to set voltage and the frequency from the initial to the set one. The start-up ramp slope may be changed via RS-232
- Set the rotation speed of a motor according to the appropriate Voltage/Frequency ratio.
- Configurable input (pin 1 and 2 of J4):
 - o Reverse mode: Changing the rotation direction for the next start-up of a motor by applying voltage between 15 and 154 V
 - o Mid power mode: Changing the output frequency in V/F mode from nominal to a mid-power frequency by applying voltage between 15 and 154 V.
- Monitoring the status of the input and output voltage through the contacts of two separate solid-state relays.
- Set and monitor parameters via RS-232.

The ODX-3000 is equipped with a maximum average power protection as well as maximum output peak current protection. This protects the semiconductors even when an output short-circuit occurs. It also features a disable function for input under-voltage, which allows protecting the batteries from harmful discharges.

INSTALLATION

- The unit has 4 threaded holes for the fixation on a mounting surface.
- The unit has internal fans. For an appropriate cooling, the air input and output should be free of elements that cause an air flow reduction (minimum recommended distance to other objects 50 mm).
- Make connections as shown in the figure.
- The default output frequency is 50 Hz. For 60 Hz simply actuate the DIP-switch as indicated in the figure.

For safety reasons, the following requirements must be met:

- Provide the equipment with some kind of protective enclosure that complies with the electrical safety directives in effect within the country where the equipment is installed.
- Include an input fuse with a rating immediately higher than the maximum input current.
- Use cables of adequate cross-section to connect inputs and outputs. The following table lists the maximum currents and the minimum cross-sections for the cables used for each power connection.

	Input 24 V	Input 36 V	Input 48 V	Input 72 V	Input 110 V	Output 230 V	Output 400 V
Maximum current	140 A	130 A	100 A	66 A	44 A	7.55 A	4.4 A
Cable cross-section	50 mm ²	50 mm ²	25 mm ²	16 mm ²	10 mm ²	1.5 mm ²	1.5 mm ²

RS232 communication port

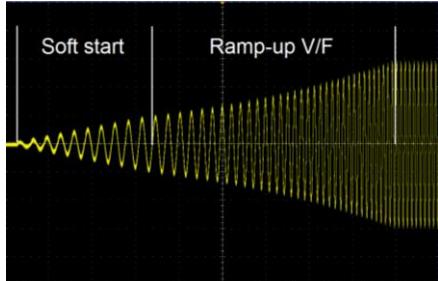

It is possible to control and monitor the unit via RS232 by means of an application tool named PAM. This application is free and can be downloaded from the Premium web site

It is also possible to control and monitor the unit directly using the protocol showed in table:

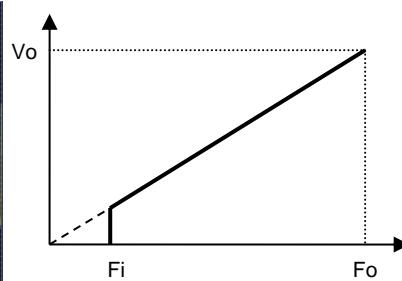

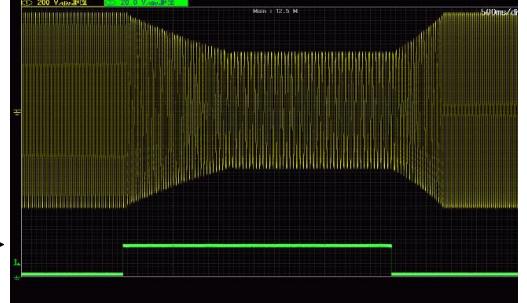

Protocol configuration: ASCII code, 9600 bauds, parity none, 8 bits, 1bit stop

OVERLOAD PROTECTION

Protection against overloads and short-circuits	By current limiting at I_{opk} By I^2t . The unit shutdowns when the current-time is over the continuous operation curve	
Overload protection recovery	Every 4 seconds after shutdown, the unit tries to restart up to 5 times. If the overload persists, the unit remains shutdown until an input reconnection .
